Welcome to TMF ' s new gift planning website. Gift planning vehicles are tools to help you implement your charitable goals. As you discern the " why " of your giving, we invite you to explore our new website and to share your thoughts, ideas, and philanthropic vision with our team.

The main objective of the work presented in this Licentiate of Engineering thesis is to investigate and model the fatigue crack propagation behaviour of the nickel-based superalloy Inconel 792, with special attention to the industrial lifing of high-temperature components. In-phase (IP) crack propagation tests have been performed at different temperatures and loading regimes, including extended hold times. The observations from these tests have been the basis for establishing several hypotheses to describe the crack growth behaviour, which progressively have been verified experimentally and numerically. Most prominently, it has been observed that crack closure has a substantial impact on crack growth and can explain, to a large degree, the crack growth behaviour for this material under the conditions studied. This phenomenon has been observed experimentally and modelled numerically to extend further the precision of the methodology. Huvudsyftet med arbetet som presenteras i denna licentiat avhandling ä r att unders ö ka och modellera utmattnings sprickv ä xtbetendet hos den nickelbaserade superlegeringen Inconel 792, med s ä rskild uppm ä rksamhet riktad mot lusst ä ngsmodellering av h ö gtemperaturkomponenter i en industriell kontext. I-fas (IP) sprickv ä xtprov har utf ö rts vid olika temperaturer och belastningsregimer, inklusive h ä lltider. Observationerna fr ä n dessa tester har legat till grund f ö r hypoteser f ö r att f ö rklara spricktillv ä xtbetende, vilka successivt har verifierats experimentellt och numeriskt. Mest framtr ä dande har det observerats att sprickslutning har en v ä sentlig inverkan p ä sprickv ä xten, och kan i stor utstr ä cknin g ö rklara sprickv ä xten f ö r detta material under studerade f ö rh ä llanden. Detta fenomen har observerats experimentellt och modellerats numeriskt f ö r att f ö r b ä ttra metodens precision.

Materials covered include carbon, alloy and stainless steels; alloy cast irons; high-alloy cast steels; superalloys; titanium and titanium alloys; refractory metals and alloys; nickel-chromium and nickel-thoria alloys; structural intermetallics; structural ceramics, cermets, and cemented carbides; and carbon-composites.

Twenty-seven papers from fatigue researchers and practitioners review in detail recent progress in the development of methods to predict fatigue performance of materials and structures and to assess the extent to which these new methods are finding their way into practice. The papers, from the ASTM
